

Case Study Template (Photo, Video, Dev)

Your Information

Berram Moore

Full Stack Web Development

Duplicate the page below for as many projects as you intend to include in your portfolio. Three (3) really strong well positioned projects is worth more than five-ten projects that are poorly positioned. Required Minimum of three (3) projects.

This space was intentionally left blank.

Project Title

Remain functional and descriptive, include the client in the title where relevant.

Bastet — Discreet DV Safety & Resource Navigation Tool

Objective

What were you specifically asked to do by the client or project brief? What is the reason behind the work? What was the need or problem that sparked the work being created?

What Was the Problem?

Domestic violence survivors in crisis need immediate access to shelter and support resources. Existing tools are either too complex to navigate under stress, require account creation, or leave identifiable traces on shared or monitored devices. The brief was clear: build something that works in seconds, leaves no trace, and feels nothing like a traditional help app.

Core Problem Statement

Victims experiencing domestic violence need a way to find safe shelters and support resources immediately, without exposing themselves to risk or navigating complex existing systems.

Design Principles Locked at Outset

- Trust Is the Product — every decision evaluated against whether it builds or breaks user trust
- Privacy Is Table Stakes — no account, no history, no stored location, no trace
- Discretion Over Visibility — app icon designed to pass as a casual game
- Navigation Tool Only — no chat, no push notifications, no community features

Synopsis

What is this work similar to? Does it reference another work? What were the inspirations that motivated you and the work?

Inspiration & Context

Bastet is named for the Egyptian goddess Bastet — protector of women, guardian of homes, and watchful presence. The name frames the app's core identity: quiet protection, not crisis branding.

The app was designed to feel like nothing it actually is. On a home screen it reads as an indie game. Inside the app it reads as a composed, private tool. This tension between disguise and function informed every design and engineering decision made across four milestones.

What Makes It Different

- No account required — ever
- Location used once, on-device only, never transmitted or stored
- Quick Exit closes the app and clears it from recent apps in under 120ms
- App icon designed as a pixel/16-bit Bastet mark — passes the glance test as a game
- 21 verified South Carolina shelters with callForAddress pattern for confidential locations

Process

What you did and how you did it. Focus on the highlights or most crucial pieces to establish context for how you approach your work.

The project was structured across four milestones, each with a defined scope and completion criteria. Every milestone was closed before the next began — no features shipped without the safety baseline in place.

Milestone 1 — Safety Baseline

The non-negotiables. Nothing ships without these.

- Quick Exit — closes app, clears from recents, opens neutral destination (weather.com)
- Privacy cover screen — activates on app background, no content flash on restore
- Location permission flow — rationale shown, graceful denial handled
- No account, no login, no stored identity

Milestone 2 — Data Hardening

Real verified data. No test fixtures in production.

- Schema v2.1 — 21 verified SC shelters, flat JSON, spec-compliant
- callForAddress pattern — confidential shelters never show directions button
- Runtime schema validator — invalid entries filtered on startup, logged in dev
- Haversine distance formula — deterministic, no NaN or fallback edge cases
- Graceful handling of GPS timeout, permission denied, services off

Milestone 3 — UX Design System

Visual identity locked. Zero hardcoded values remaining.

- Design tokens — theme.ts with colors, spacing, radius, shadows, typography
- Playfair Display + DM Sans type pairing

- Eggplant (#614051) as primary brand color throughout
- Four UI directions explored with UI/UX specialist — current direction confirmed
- Hero copy: "We believe you. Let us help you get the support you need. No judgement."

Milestone 4 — Polish & Accessibility

Production-ready. Both platforms. All users.

- WCAG AA audit — 5 issues found and resolved across all 4 screens
- Onboarding flow — Privacy Promise + mandatory Quick Exit tutorial
- Android MaterialIcons swap — SF Symbols have no Android fallback
- Settings screen — replay onboarding, privacy statement, app version
- SafeAreaView tested on API 36 and API 30 — passing

Pre-Beta Work (Current)

- Sticky Quick Exit header on all scrollable screens — always one tap away
- Permission denied fix — users now routed to Browse All Shelters, never stuck
- Privacy statement written and hosted at bastet.app/privacy
- Beta test plan produced — Tier 1 (DV advocates), Tier 2 (trusted network)
- Logo creative brief filed — pixel/16-bit app icon in production with designer

Results

Explain the outcome of the work, indicate if the work was completed on time and budget, indicate where the work can be viewed in full (if not on your website).

Where Things Stand

Bastet is currently in pre-beta. All four development milestones are complete. The app is production-ready on iOS and Android pending App Store submission.

Technical

- React Native / Expo — cross-platform iOS and Android
- Zero third-party analytics, tracking SDKs, or advertising libraries
- 21 verified SC shelter entries — schema-validated on every launch
- WCAG AA compliant across all screens
- Quick Exit tested across all screens and interaction states

Product

- 4 design principles locked and reflected consistently across every screen

- Onboarding flow educates users on privacy and Quick Exit without friction
- callForAddress pattern protects confidential shelter locations while keeping them accessible
- Beta test plan filed — Tier 1 advocate pipeline active (3 DV advocates, 2 familiar contacts)

Status

- Development: Complete — pre-beta
- Beta: Tier 1 advocate outreach in progress
- App Store submission: Pending beta feedback and icon asset delivery
- National expansion: Planned for v2.0+ via API layer (thehotline.org / 211.org)

Project Photos

Embed project photos here and scale down to a reasonable side—include a short description of what it is we're looking at (e.g. website low resolution wireframes)

This screen allows users to quickly locate nearby shelters by displaying the distance from their current location. Using GPS, the app automatically identifies the closest shelter and prioritizes it in the interface. Selecting “**Start Directions**” launches the user’s default navigation app and begins routing them directly to the shelter.

These are the color palette for the application.
